

Monthly Testing Procedure

The monthly testing of the Security System is a requirement of all subscribers of ProVision Security Solutions and API Monitoring. The owner of the facility should have a fresh supply of batteries to accommodate all wireless devices. Panic buttons require two Energizer 386, 1.5V, Silver Oxide Cells and both the glass breaks and door contacts require a DL123A, 3 Volt Lithium Battery.

The steps below outline the system testing procedure, but before starting this process make sure you're familiar with the Arm/Disarm code for securing the security panel at the end of the day (default is 123), the abort code, and the account number. Please also fill in the line card below with your Account Number and Abort Code.

To Test The System:

1. Call API Monitoring at 1-866-281-1427; provide your Name, Account Number, and Abort Code.
2. Tell the operator that you want to put the system into test mode.
3. Explain to the operator that you will be performing testing on all zones.
4. They will inform you that you are now in test mode for the amount of time you requested.
5. Set your panel and begin testing your zones.
6. After arming all zones call API again.
7. Ask them to confirm that they received all zones.
8. Tell them you are done with the procedure and to end test mode.
9. The monthly Security System test is complete.

Alarm Monitoring

1-866-281-1427

Account Number: _____

Abort Code: _____

Call the number above for false alarms within five minutes of alarm.

If you have any questions about the testing procedure, please feel free to contact us.
